Professional Summary

IT professional with experience supporting enterprise users while developing automation tools that reduce manual work and improve data accuracy. Combines technical support, scripting and process improvement to solve operational problems across multiple departments.

Technical Skills

Programming:	Python, Bash/Shell Scripting, C++, SQL, HTML, CSS
Operating Systems:	Linux, Windows, iOS
IT Operations:	Technical Support (Tier 1-4), Endpoint Management, Mobile Device Management, Software Deployment, Troubleshooting, Data Auditing, Process Automation

Professional Experience

IT Support Technician

September 2023 – Present

Mashburn Transportation Services

Bakersfield, CA

- Identified a manual daily data reconciliation process taking 30+ minutes (up to 2 hours on high-volume days) and engineered a Python pipeline to automate extraction, cleaning, and validation of source data before integration into the master dataset — reducing the process to under 5 minutes daily
- Built a Python script to analyze fleet usage data (driver, truck, job, and date records) and identify underutilized vehicles, informing decisions to sell low-usage trucks and reduce overhead costs
- Deliver Tier 1-4 technical support for 100+ endpoints, resolving hardware, software, and network issues while maintaining 95%+ first-call resolution rate
- Configure, deploy, and manage enterprise endpoints including Windows workstations and iOS mobile devices (iPhones/iPads)
- Install, configure, and troubleshoot proprietary and third-party software while maintaining security best practices

Technical Projects

Stacklab – Python and React based Deck Analysis Tool

Python, React, FastAPI, TypeScript

- Built a full-stack simulation platform in Python, React, FastAPI, and TypeScript capable of modeling complex game interactions to analyze probability and decision-making across thousands of simulated scenarios
- Architected a ~17,000-line Python simulation engine implementing hundreds of unique game rules and interactions to generate probabilistic performance metrics and strategic insights
- Built a React/TypeScript frontend that visualizes turn-by-turn simulations, exposing engine decisions and game state for interactive analysis and debugging
- Improved simulation reliability through deterministic seeding, regression testing, and validation against official game rules, prioritizing correctness and reproducibility

Education

Bachelor of Science in Computer Science – Information Systems

December 2022

California State University, Bakersfield

Bakersfield, CA
